

Alcohol and Drug Testing

Quantisal

Oral fluid has become an increasingly popular alternative or additional matrix for use in workplace drug testing. This is due to its easy non-invasive, observed collection.

The Quantisal offers a robust method of taking a sample with a visual indicator showing when enough oral fluid has been collected from the donor. This will enhance the detection of drugs if present and ensure sufficient oral fluid has been collected each time.

The sample will be sent to our UKAS accredited laboratory in the UK, providing analysis with a legally defensible drug test programme for you and your company.

The sample can be analysed at two different levels, with the initial screen used to determine the presence of drugs or their metabolites. The second test using confirmation analysis would accurately establish the exact drug type and levels present.

Where a non-negative result has been confirmed using confirmation analysis, a medical review of the result would be carried out by a qualified medical review officer.

Hampton Knight can provide competency training, testing protocols and consent forms to ensure your testing process is robust and legally defensible.

The standard panel of drugs includes:

 Amphetamine	 Cocaine
 Benzodiazepines	 Methamphetamine
 Cannabis (THC)	 Opiates

Key Features

-  10 minute test
-  Volume adequacy indicator
-  Non-invasive process
